

## Sprint-2

### Image Preprocessing:

- **Import the Image Data generator Library**

Image data augmentation is a technique that can be used to artificially expand the size of a training dataset by creating modified versions of images in the dataset.

The Keras deep learning neural network library provides the capability to fit models using image data augmentation via the Image Data Generator class .Let us import the Image Data Generator class from Keras.

```
Import image data generation.ipynb X
E: > IBM > IBM-Project-47132-1660796682 > Final Deliverables > Image Preprocessing > Import image data generation.ipynb > #importing image data generator library
+ Code + Markdown ...
Select Kernel
Python
[1] #importing image data generator library
Python
[2] from keras.preprocessing.image import ImageDataGenerator
```

- **Configure image Data Generator class**

Image Data Generator class is instantiated and the configuration for the types of data augmentation

There are five main types of data augmentation techniques for image data; specifically:

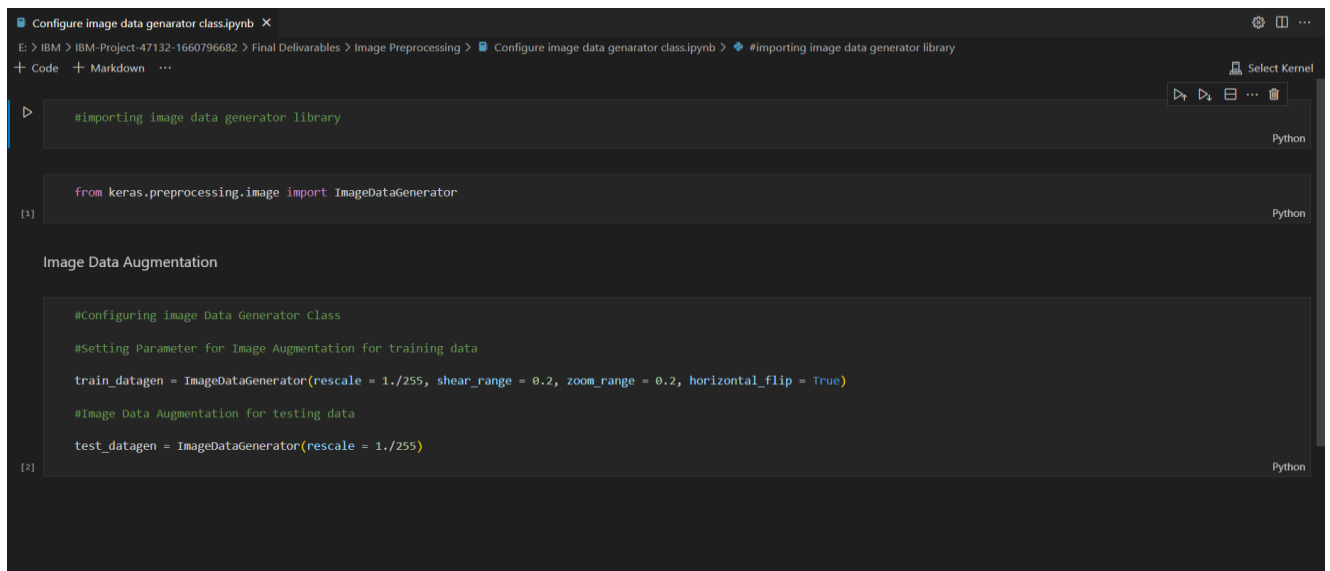

Image shifts via the width shift range and height shift range arguments.

The image flips via the horizontal flip and vertical flip arguments.

Image rotations via the rotation range argument

Image brightness via the brightness range argument.

An instance of the Image Data Generator class can be constructed for train and test.

The screenshot shows a Jupyter Notebook interface with a dark theme. The notebook is titled "Configure image data generator class.ipynb". The file explorer on the left shows the path: E:\IBM> IBM-Project-47132-1660796682> Final Deliverables> Image Preprocessing> Configure image data generator class.ipynb. The notebook contains two code cells. The first cell, labeled [1], imports the ImageDataGenerator class from keras.preprocessing.image. The second cell, labeled [2], is titled "Image Data Augmentation" and contains comments and code for configuring the Image Data Generator Class. It sets parameters for training data augmentation (rescale, shear\_range, zoom\_range, horizontal\_flip) and testing data augmentation (rescale).

```
#importing image data generator library

from keras.preprocessing.image import ImageDataGenerator

Image Data Augmentation

#Configuring Image Data Generator Class
#Setting Parameter for Image Augmentation for training data
train_datagen = ImageDataGenerator(rescale = 1./255, shear_range = 0.2, zoom_range = 0.2, horizontal_flip = True)
#Image Data Augmentation for testing data
test_datagen = ImageDataGenerator(rescale = 1./255)
```

- **Apply Image Data Generator Functionality to Trainset and Test set**

Let us apply Image Data Generator functionality to Trainset and Test set by using the following code

For Training set using flow from directory function.

This function will return batches of images from the subdirectories Cyclone, Earthquake, Flood, Wildfire together with labels 0 to 3 {Cyclone: 0, Earthquake: 1, Flood: 2, Wildfire: 3}

```

```

```
In [17]: from keras.preprocessing.image import ImageDataGenerator
```

### Image Data Augmentation

```
In [18]: #Configuring image Data Generator Class

#Setting Parameter for Image Augmentation for training data

train_datagen = ImageDataGenerator(rescale = 1./255, shear_range = 0.2, zoom_range = 0.2, horizontal_flip = True)

#Image Data Augmentation for testing data

test_datagen = ImageDataGenerator(rescale = 1./255)
```

## Apply ImageDataGenerator Functionality To Trainset And Testset

```
In [19]: #Performing data augmentation to train data

x_train = train_datagen.flow_from_directory('/content/drive/MyDrive/dataset/dataset/train_set', target_size = (64,64), batch_size = 5, color_mode = 'rgb')

#performing data augmentation to test data

x_test = test_datagen.flow_from_directory('/content/drive/MyDrive/dataset/dataset/test_set', target_size = (64,64), batch_size = 5, color_mode = 'rgb')

Found 742 images belonging to 4 classes.
Found 198 images belonging to 4 classes.
```
